

Tilt & Slide Doors

Livingwood Windows Tilt and Slide Doors offer the ability to ventilate a room while having the option of up to 50% openable area, unlike French Doors which are either open or shut.

The tilt function of the Door (like a tilt and turn window) enables ventilation to a room where the door is the only openable unit in a room.

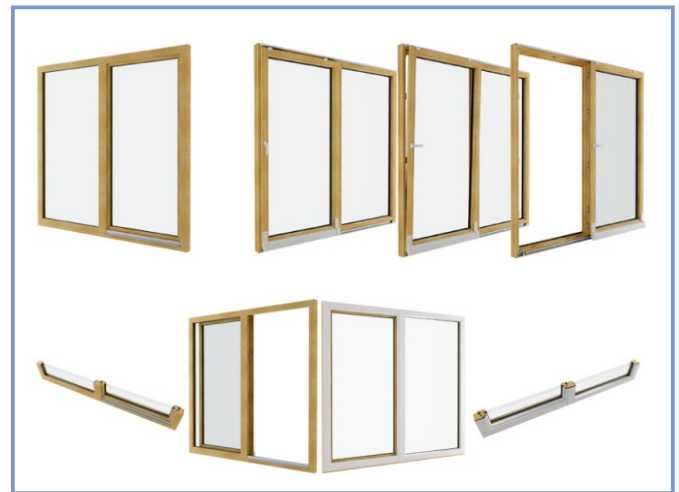

A further advantage of this system is the master leaf slides behind the fixed light taking up virtually no space within the room.

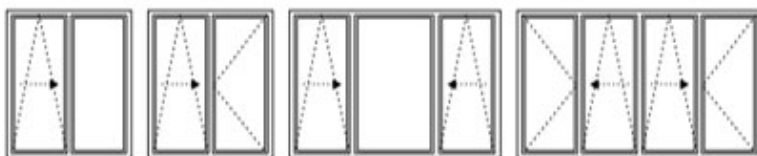

The innovative runner technology used on the Tilt & Slide Doors enables them to run smoothly from their tilt to sliding position, offering ventilation a secure locked position. This combined with the multi-point locking mechanism creates a class leading, economical patio door solution.

Advantages of Tilt & Slide Unit:

- U value as low as 0.8 W/m²K
- Very high levels of airtightness (better than any other door system)
- Background ventilation to a room
- Various opening configurations
- Space efficient
